ABOUT US

Trump Coir Products (Pvt) Ltd is a registered company in Sri Lanka since 2009 with over a decade in business.

Its formation emanated from a gathering of Professionals with an explicit interest in the Horticulture sphere. Coco Peat, Coconut Husk Chips, Coir Fiber, and Tropical foliage comprise the exportable Agro products.

The company has grown in stature with an expanded factory base in Kurunegala and an additional Processing Facility located in Dambulla for buffered and super-washed chips & peat and currently offers a wide product range to dedicated buyers in Europe, North America, Latin America, Australasia, Middle East, Taiwan and Far Eastern Markets.

Our production facility and processing is subject to stringent quality control by well experienced and qualified staff which is of paramount importance to our customers.

We have proved our capability to be flexible and adaptive to our customer needs as best as possible and serve them with diligence and consistency.

SUSTAINABLE GROWING MEDIUMS

DAMBULLA, SRI LANKA.

www.trumpcoir.com

PRODUCING AN ENVIRONMENTAL CONDUCTIVE SUBSTRATE

DAMBULLA, SRI LANKA

THE PROCESS

When coconut husk is processed to coir fiber, the emanating by-products are “fiber” (1/3 of the husk) and “Coco Peat” (2/3 of the husk). Coco peat is also called coir dust or coir peat or coir pith. Coco peat is widely used as a growing medium in the horticulture industry and is a superior alternative for Peat Moss. It also bears a very high water holding capacity and gives maximum efficiency for fertilizer usage.

Coco Peat is subject to washing, sieving and drying before being converted into the final product. It is pressed into different block sizes in accordance with customer requirements and then shipped to requisite buyers. Coco Peat and Husk chips are sometimes mixed in different ratios before processing, and conversion into the final product depends on the type of vegetation and customer requirement. In horticulture, Coco Peat is recommended as a substitute for peat moss since it is free of bacteria and fungal spores. It also sustains environmental damage unlike the ill effects of Peat mining.
